

## Why Mining Closed Graph Patterns?

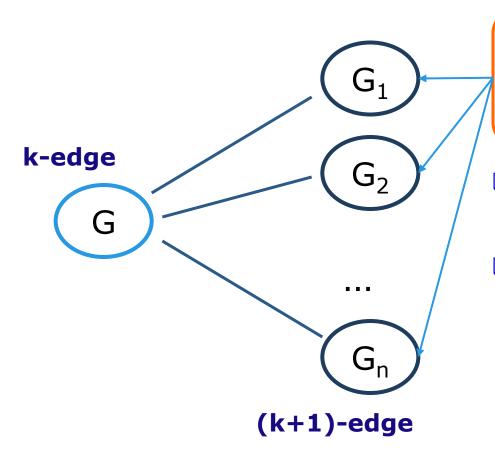

- □ Challenge: An **n**-edge frequent graph may have 2<sup>n</sup> subgraphs
- Motivation: Explore closed frequent subgraphs to handle graph pattern explosion problem
- ☐ A frequent graph G is *closed* if there exists no supergraph of G that carries the same support as G

If this subgraph is *closed* in the graph dataset, it implies that none of its frequent super-graphs carries the same support

- Lossless compression: Does not contain non-closed graphs, but still ensures that the mining result is complete
- Algorithm CloseGraph: Mines closed graph patterns directly

# **CLOSEGRAPH: Directly Mining Closed Graph Patterns**

CloseGraph: Mining closed graph patterns by extending gSpan (Yan & Han, KDD'03)

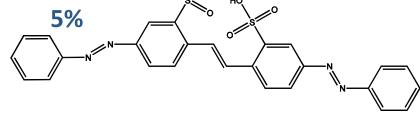

At what condition can we stop searching their children, i.e., early termination?

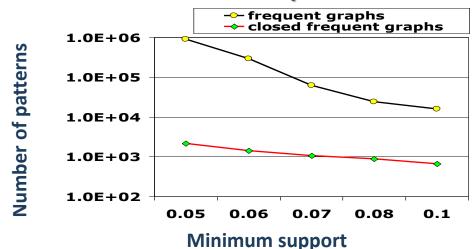

- Suppose G and G<sub>1</sub> are frequent, and G is a subgraph of G<sub>1</sub>
  - If in any part of the graph in the dataset where G occurs,  $G_1$  also occurs, then we need not grow G (except some special, subtle cases), since none of G's children will be closed except those of  $G_1$

## **Experiment and Performance Comparison**

- ☐ The AIDS antiviral screen compound dataset from NCI/NIH
- ☐ The dataset contains 43,905 chemical compounds
- Discovered Patterns: The smaller minimum support, the bigger and more interesting subgraph patterns discovered

#### # of Patterns: Frequent vs. Closed

#### **Runtime: Frequent vs. Closed**
